

## 8.2. Transforming probability distribution (density) function 1

Let  $p(x)$  be PDF -  $dW = p(x)dx$   
probability to find  $x, x+dx$   
 $x_{\min}$   $x_{\max}$

Normalization:  $1 = \frac{1}{(x_{\max} - x_{\min})} \int_{x_{\min}}^{x_{\max}} p(x)dx = \int_0^1 p(x)dx$

$p(x)$  is a probability density!

Let  $x = x(y)$  be a monotonous function.

Ausatz:

$$p(x)dx = p(x(y)) \left| \frac{dx}{dy} \right| dy =: \tilde{p}(y) dy$$

Let us start with eq. distr.  $p(x) = 1 \Rightarrow$

$$\tilde{p}(y) = \left| \frac{dx}{dy} \right| ; \text{ without loss of generality}$$

$$\frac{dx}{dy} > 0 : \tilde{p}(y) = \frac{dx}{dy} \Rightarrow$$

$$F(y) - F(y_0) = \int_{y_0}^y \frac{dx}{dy'} dy' = x - x_0$$

$$= \int_{y_0}^y \tilde{p}(y') dy'$$

(2)

$$F(y) = F(y_0) + x - x_0 ; \text{ ~~QED~~ } \text{ ~~QED~~ }$$

$$F(y) = x \Rightarrow y(x) = F^{-1}(x)$$

---

$F$  is indefinite integral (Stammfunktion)

$F^{-1}$  is inverse function of  $F$  (Umkehrfunktion)

---

Example: We want exponentially distributed RV's  
 $p(x) dx = f(y) dy = e^{-y} dy = \frac{dx}{dy} dy$

$$F(y) = F(y_0) + \int_{y_0}^y e^{-y'} dy'$$

$$= F(y_0) - [e^{-y'}]_{y_0}^y$$

$$= F(y_0) - e^{-y} + e^{-y_0}$$

$$= F(y_0) + x - x_0 \quad \text{Let } x_0 = y_0 = 0$$

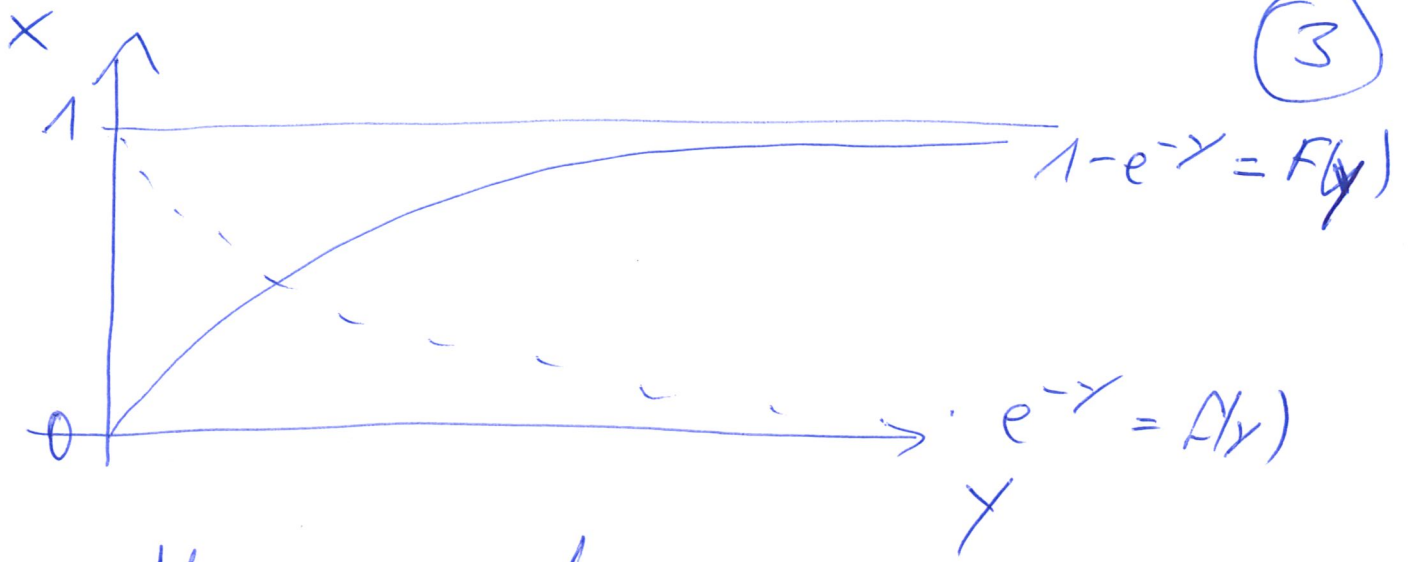

$$\Rightarrow e^{-y} = 1 - x$$

$$y(x) = -\ln(1-x)$$

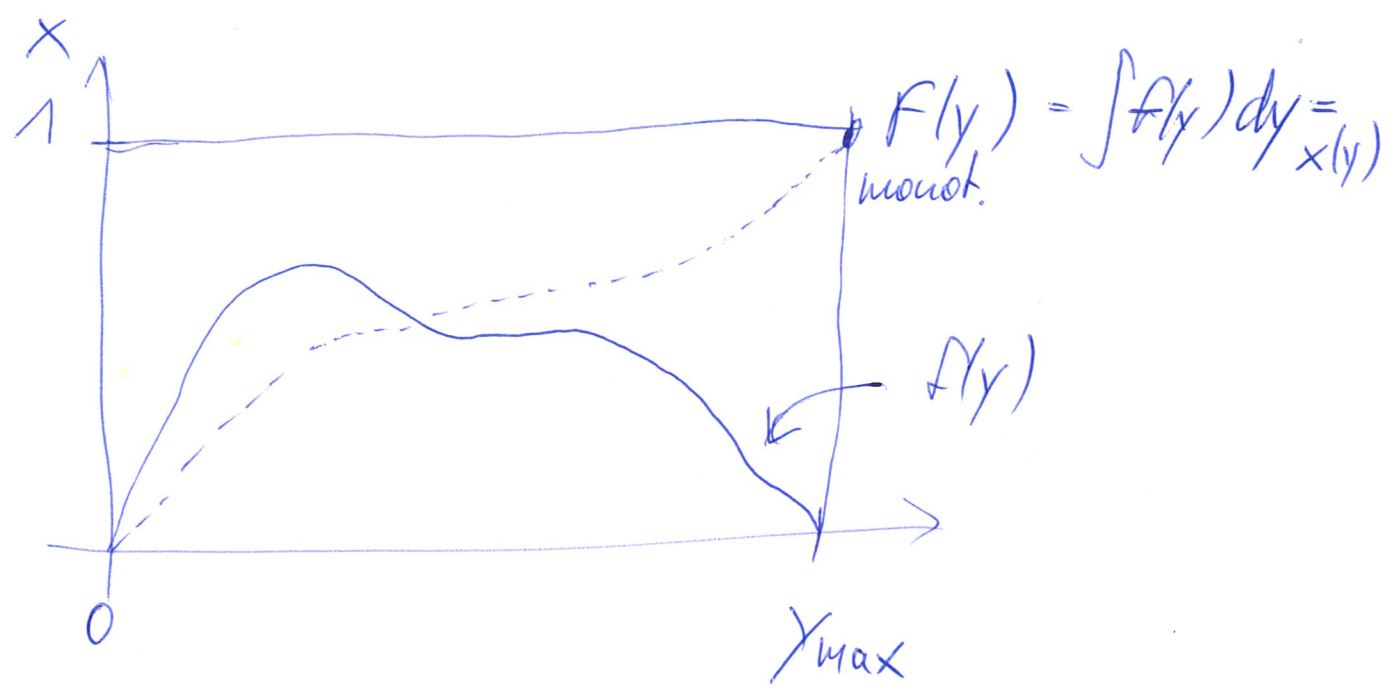

---

Note:  $x = 1 - e^{-y} ; \frac{dx}{dy} = e^{-y}$   
 $dx = e^{-y} dy ! \quad \int$

3

More general:

## 8.24. Rejection Method

(4)

What if  $F^{-1}(y)$  cannot be computed?

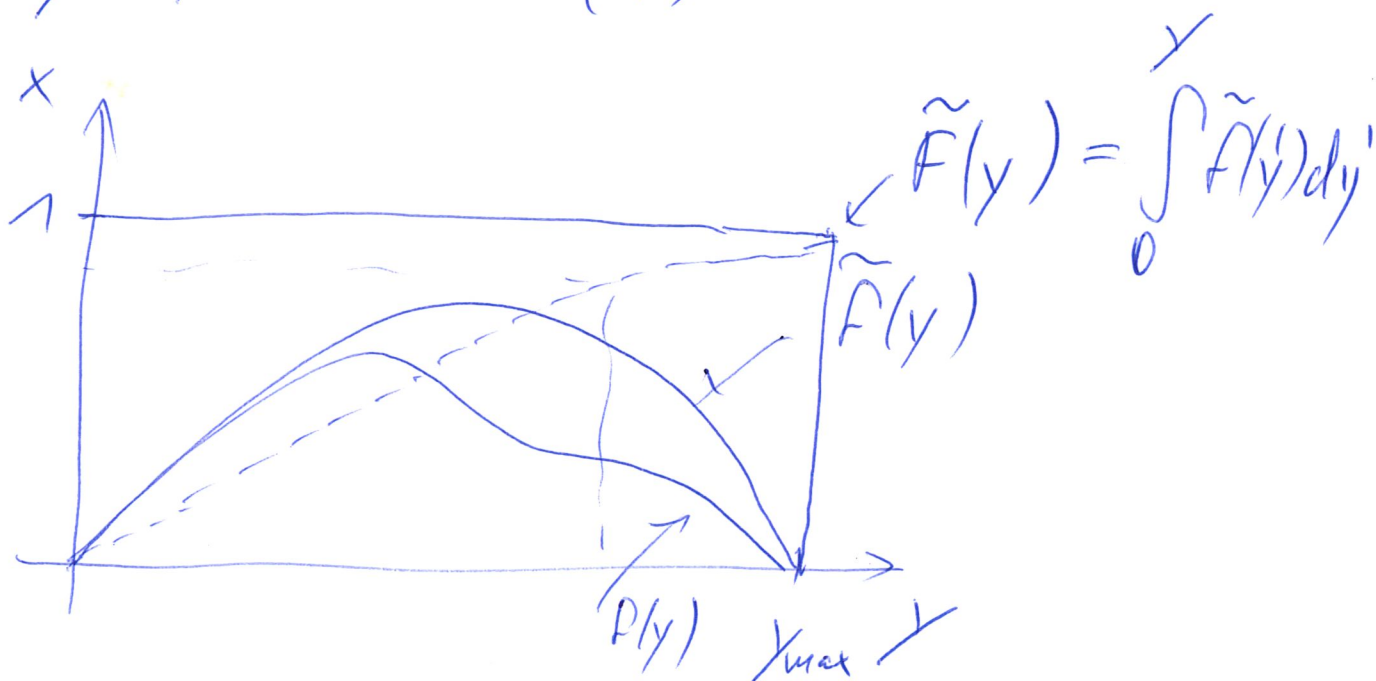

Use majorant  $\tilde{f}(y) \geq f(y)$

$(p(x)dx = f(y)dy)$  ; then

$$\tilde{F}(y) = \tilde{F}(y_0) + \int_{y_0}^y \tilde{f}(y') dy' = x - x_0$$

$$x_0 = y_0 = 0 ; \quad p(x)dx \stackrel{=1}{=} \tilde{f}(y)dy$$

$$y = y(x) = \tilde{F}^{-1}(x)$$

With  $x_i \in (0,1)$  equally distr.

$x_i = \tilde{F}^{-1}(x_i)$  is distr. acc. to  
PDF  $\tilde{f}(y)$

⑤

Next: choose eq. distr. RN  $x' \in [0, \tilde{f}(y)]$

If  $x' \leq f(y)$  accept. (prob.  $\frac{f(y)}{\tilde{f}(y)}$ )

If  $x' > f(y)$  reject

Seq.  $x_0, x_1, \dots, x_i, x_{i+1}, \dots$

Seq.  $x'_0, \overset{\uparrow \text{Rej.}}{x'_1}, x'_2, \dots, x'_i, \overset{\uparrow \text{Rej.}}{x'_{i+1}}, \dots$

$y'_i = \tilde{F}^{-1}(x'_i)$  is distr. acc. to  $f(y)$ !

Good majorant:  $\tilde{f}(y) = \frac{C_0}{1 + (y - y_m)^2 / a_0^2}$

Maximum is at  $y = y_m$ ;  $\tilde{f}(y_m) = C_0$

FWHM =  $2a_0$

$$\tilde{F}(y) = a_0 C_0 \arctg\left(\frac{y - y_m}{a_0}\right) + \tilde{c}$$

# Box-Muller Algorithm: Gaussian PDF (6)

$$\begin{aligned} p(x_1) p(x_2) dx_1 dx_2 &= f(y_1) f(y_2) dy_1 dy_2 \\ &= 1 \quad = 1 \\ &= |\det J| dy_1 dy_2 \\ &= \left| \frac{\partial f(x_1, x_2)}{\partial x_1, x_2} \right| dy_1 dy_2 \end{aligned}$$

(claim:  $x_1 = \sqrt{-2 \ln x_1} \cos(2\pi x_2)$   
 $y_2 = \sqrt{-2 \ln x_1} \sin(2\pi x_2)$  does it:

~~det J~~  $y_1^2 + y_2^2 = -2 \ln x_1 \Rightarrow x_1 = \exp(-\frac{1}{2} y_1^2 - \frac{1}{2} y_2^2)$   
 $x_2 / y_1 = \tan(2\pi x_2) \Rightarrow x_2 = \frac{1}{2\pi} \arctan\left(\frac{y_2}{y_1}\right)$

$$\det J = \frac{1}{2\pi} \left( \frac{-\cancel{x_1} \exp(-)}{\cancel{x_1}^2 (1 + \frac{y_2^2}{y_1^2})} - \frac{-\frac{y_2}{x_1} \exp(-)}{-\frac{y_2^2}{x_1^2} (1 + \frac{y_2^2}{y_1^2})} \right)$$

$$\begin{pmatrix} -y_1 \exp(-) & -y_2 \exp(-) \\ \frac{1}{2\pi} \frac{-\frac{y_2}{x_1}}{1 + \frac{y_2^2}{y_1^2}} & \frac{1}{2\pi} \frac{\frac{1}{x_1}}{1 + \frac{y_2^2}{y_1^2}} \end{pmatrix}$$

$$= \frac{\exp(-x_1^2/2)}{\sqrt{2\pi}} \cdot \frac{\exp(-x_2^2/2)}{\sqrt{2\pi}}$$

(5a)

$$\text{Let } x_0 = 0, y_0 = 0$$

$$\begin{aligned} x = \tilde{F}(y) &= a_0 c_0 \operatorname{arctg} \left( \frac{y - y_m}{a_0} \right) + \tilde{c} \\ &= \int_0^y \tilde{f}(y') dy' \end{aligned}$$

$$x_0 = \tilde{F}(y_0) = 0 = a_0 c_0 \operatorname{arctg} \left( \frac{-y_m}{a_0} \right) + \tilde{c}$$

$$\Rightarrow \tilde{c} = + a_0 c_0 \operatorname{arctg} \frac{y_m}{a_0}$$

$$\Rightarrow y(x) = y_m + a_0 \tan \left( \frac{x}{a_0 c_0} + \operatorname{arctg} \frac{y_m}{a_0} \right)$$

---

$$y_i = y(x_i) \text{ distr. aa. } \tilde{F}(y)$$
